

**Please replace the paragraph beginning at page 1, line 9, with the following rewritten paragraph:**

A2

--Generally, there is known a wrist watch having a design in which a decorative bezel is attached at a region surrounding a glass for protecting a dial. The bezel is formed in a doughnut shape in conformity with an outer shape of a wrist watch and is attached to a surface of the wrist watch. Further, the bezel serves also as a lid of a case main body containing a watch mechanism. In that case, a glass member is adhered or welded to a hole portion of the bezel in the doughnut shape, the bezel is attached to press against the case main body of the wrist watch to thereby hermetically close the case by interposing a packing therebetween, and the bezel cannot be removed without a special tool or special technology/technique. Meanwhile, a bezel attached by a so-to-speak rotational bezel structure, is rotatably attached to the case main body and the bezel is attached thereto such that the bezel is not removed unless a special tool or special technology/technique is used.--

**Please replace the paragraph beginning at page 2, line 11, with the following rewritten paragraph:**

of design to suit the taste of a user and which is capable of exchanging the bezel easily by a user without the need for a special tool or special technology/technique.--

**Please replace the paragraph beginning at page 2, line 17, with the following rewritten paragraph:**

A4

--In order to achieve the above-described object, the invention is characterized in that a screw mount structure including a bayonet structure is provided to attach a bezel to a wrist watch main body and comprises a projected portion or a plurality of first projections having a front end in a semispherical shape provided on one of the bezel and about a circumference of an opposed (or upper) face of the main body and urged to the other of the bezel and the opposed face by an elastic member, and a recess portion or a plurality of second projections provided on the other of the bezel (about an inner circumference thereof) and the opposed face and fitted to the front end of the projected portion or the first projections. Further, the bezel may be attached with a bayonet part comprising an elastic member integrally formed with the projected portion on a side of the opposed face of the main body and the main body may include the recess portion on the side of the opposed face of the bezel. Further, the recess portion may be formed by being surrounded by the projected portion projected to a face of forming thereof.--
